## Updating MobileMapper Office Software

18 July 2007

1. Save the following files to a temp directory:
   a. **C:/Program Files/Common Files/THALES Navigation/user.csl** (a list of parameters for new coordinate systems you create or old ones you revise)
   b. **C:/Program Files/MobileMapper Office/RxDload.ini** (a list of parameters for RINEX providers - primarily the ftp addresses for observation and navigation files required for post-processed differential correction)
   c. **C:/Program Files/MobileMapper Office/refsites.ini** (a list of coordinates of CORS you may have updated)

2. Uninstall any older version of MobileMapper Office by clicking the Windows Start button and then selecting **Control Panel > Add or Remove Programs > MobileMapper Office ver. X.XX**

3. Double-click **My Computer** on your PC's desktop and type "ftp.magellangps.com" in the address field to go to the Magellan professional products tech support FTP site. Click the **Folders** icon at the top of the screen and navigate to go to the /Mobile Mapping/MM Office/Software/ folder. (You may also use an FTP client application or some Internet browsers to go to the ftp site.)

4. Copy the latest MobileMapper Office update (zip) file to any directory on your hard drive. Open the zip file and extract all of the contents to the same directory. This action will write all the installation files to a sub-directory called Disk 1.

5. Launch **setup.exe** on the Disk 1 subdirectory either by using Windows Explore and double-clicking on the **setup.exe** file or by clicking **Start > Run**, browsing for **setup.exe** on the **Run** window and clicking **Open**.

6. Follow the instructions on the screen until the software has finished installing.

7. You do not have to reboot your computer after updating MobileMapper Office.
